

**European Registries for Rare Endocrine Conditions (EuRRECa):
Results from the Platform for e-Reporting of Rare Conditions (e-REC)**

Introduction

e-REC (e-Reporting of Rare Endocrine Conditions) is an electronic reporting platform which acts as a registry that captures activity and allows for a better understanding of the occurrence of a wide range of rare endocrine and bone conditions. For clinical networks such as Endo-ERN and ERN-BOND, the e-REC platform allows continuous reporting of core indicators of activity and enables these clinical networks to objectively map the conditions and related activity. However, the platform is open to all centres that look after people with such conditions and not just limited to reference centres within ERNs. The e-REC platform also assisted the Rare Disease Committee of the ESE in mapping the occurrence of COVID-19 infection in people with rare conditions.

Aim

This report has been developed to describe the current activity in e-REC over a 3.5-year period from July 2018 to December 2021 inclusive.

Methods

The e-REC platform issued invitations to clinicians who had registered to participate in e-REC from July 2018 to December 2021 to ask them to complete a monthly return. Participants can create a bespoke reporting set up and can report any newly encountered cases of any of the conditions that have been included in Endo-ERN, ERN-BOND and more recently, COVID-19 infections.

Results

By December 2021, a total of 61 centres from 22 countries had reported on the e-REC. Of these 61 centres, 28 are in Endo-ERN only, 16 are in Endo-ERN and ERN-BOND, 3 are in ERN-BOND only and 14 are in no ERNs.

Country	Centres	Country	Centres
 Austria	5	 Israel	1
 Belgium	7	 Italy	9
 Croatia	1	 Latvia	1
 Czechia	1	 Lithuania	1
 Egypt	1	 Luxembourg	1
 Estonia	1	 Netherlands	6
 Finland	1	 Portugal	1
 France	2	 Romania	1
 Germany	9	 Spain	3
 Greece	2	 Sweden	2
 Hungary	1	 UK	4

Table 1 – Number of centres in each country that are active (i.e. have submitted 1 or more returns between July 2018 and December 2021).

Fig.1 – Change in the number of centres that have been actively reporting between July 2018 and December 2021. Currently, 45 paediatric centres and 51 adult centres have actively participated in e-REC. The arrow indicates the launch of the EuRR-Bone project (April 2020).

Fig. 2 – The change in cases reported between July 2018 and December 2021. A total of 10,230 new cases in adults and 5252 new cases in children have now been reported.

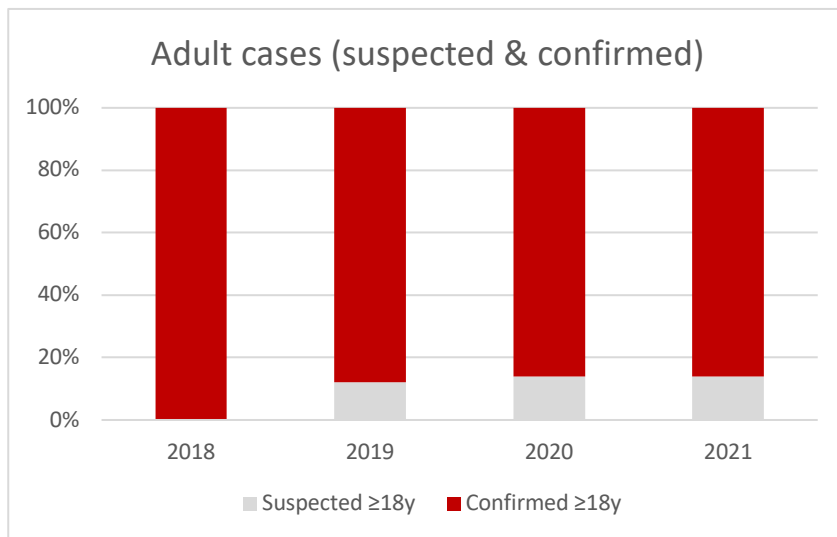

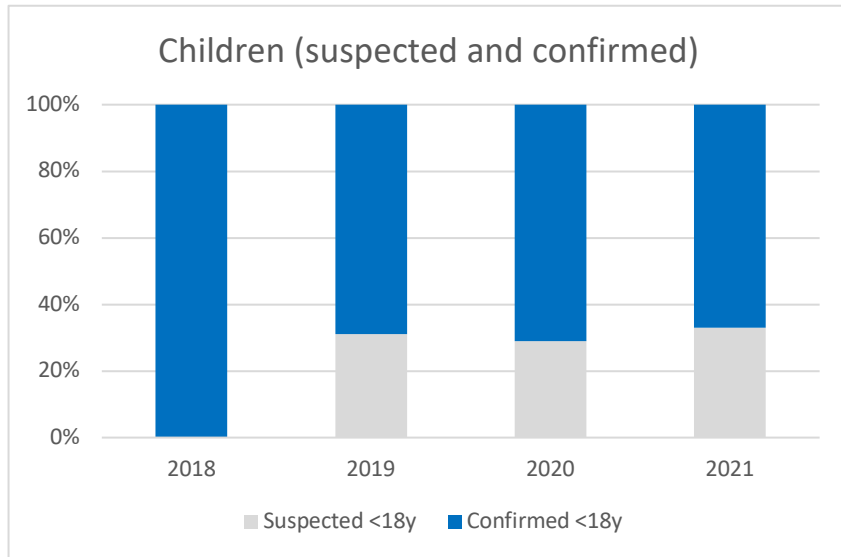

Fig 3. Since the last quarter of 2019, the platform collects information on the proportion of cases that are considered to be 'suspected' and the proportion that are considered to be 'confirmed'. Suspected cases (in grey) are shown as a percentage of total cases for children (blue) and adults (red). The platform also allows updating of previously reported suspected cases to either confirmed or excluded.

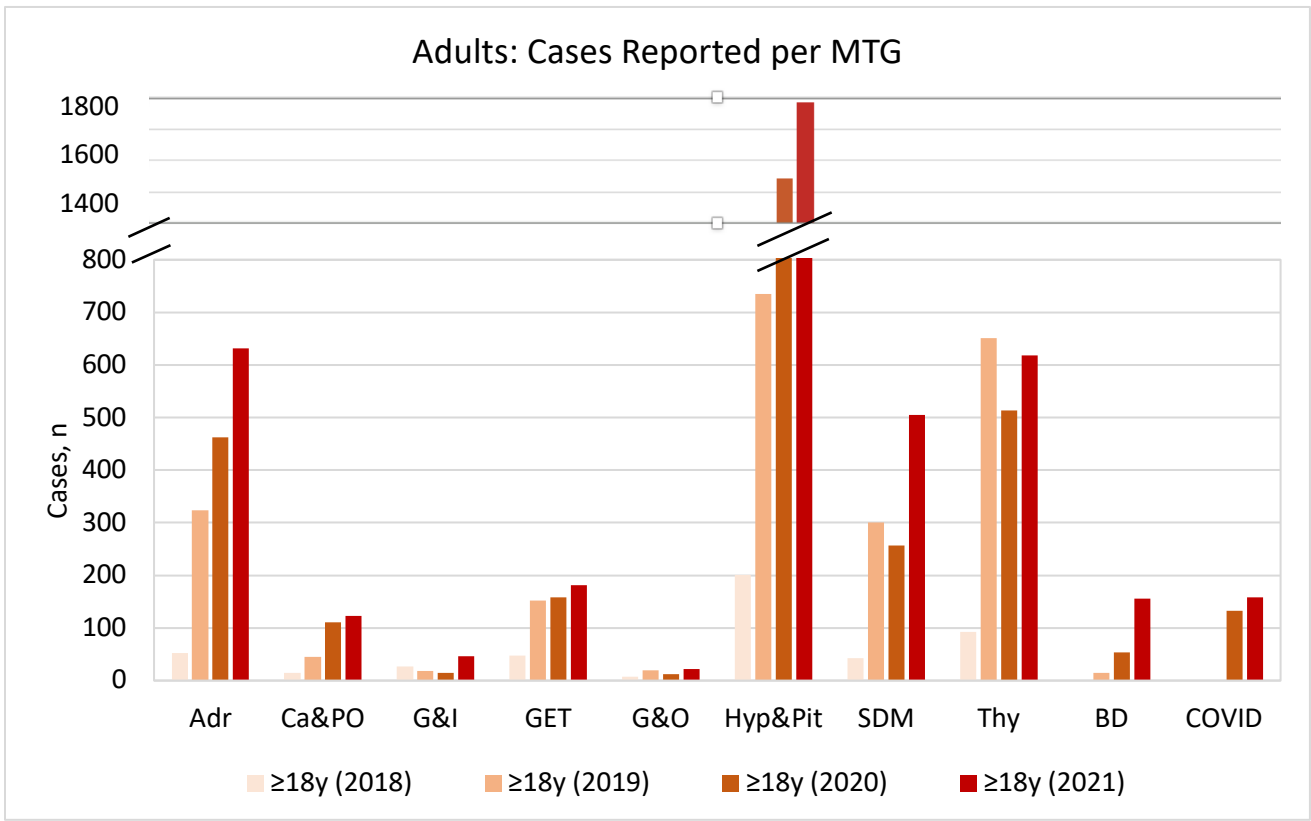

Fig.4 – Cases reported per Main Thematic Group (MTG) between July 2018 and December 2021. Conditions within the ‘Sex Development’ and ‘Pituitary’ condition groups were most commonly reported amongst children and adults, respectively. However, in general, the increase in reported conditions is across all MTGs.

Cases per centre per MTG

Condition Group	<18y			≥18y		
	Median	Min	Max	Median	Min	Max
Adrenal	6	0	26	32	1	77
Ca & PO	5	0	31	5	1	28
Gluc & Ins	6	1	14	1	0	20
Gen Endocrine Tumours	3	0	11	13	4	25
Growth & Obesity	7	1	39	1	0	5
Hypothal & Pituitary	15	0	29	91	6	255
Sex Dev & Maturation	30	10	137	22	1	89
Thyroid	16	1	31	49	5	75
Bone Dysplasia	10	1	48	8	1	25
COVID-19	2	0	15	10	0	36

Table 2 – Cases reported per centre per MTG between July 2018 and December 2021.

Fig.5a – Commonly reported conditions in children between July 2018 and December 2021; cases, n.

Children- MTG 4 (Genetic Endocrine Tumours), n=134

Children- MTG 5 (Growth & Obesity), n=412

Children- MTG 6 (Hypothal & Pituitary), n=568

Children- MTG 7 (Sex Development), n=2356

Children- MTG 8 (Thyroid), n=612

Children- Bone Dysplasia, n=319

Fig.5b – Commonly reported conditions in adults between July 2018 and December 2021; cases, n.

Adults- MTG 4 (Genetic Endocrine Tumours), n=538

Adults- MTG 5 (Growth & Obesity), n=59

Adults- MTG 6 (Hypothal & Pituitary, n=4265)

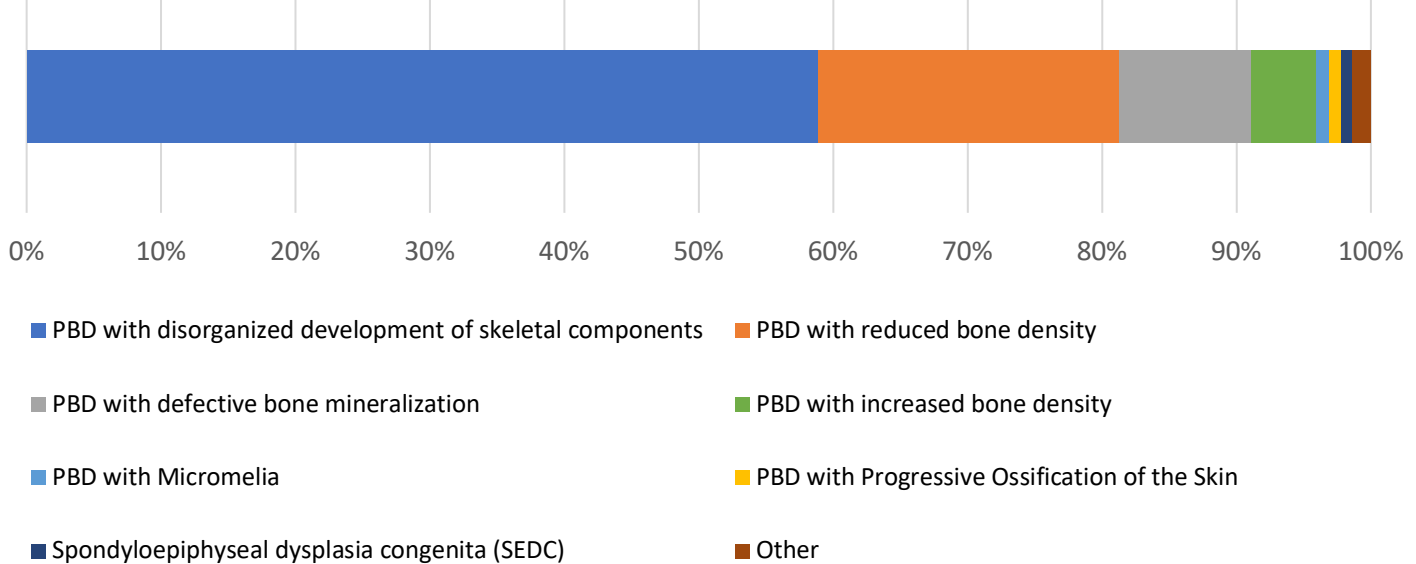

Adults- MTG 7 (Sex Development), n=1106

Adults- MTG 8 (Thyroid), n=1510

Adults- Bone Dysplasia, n=224

Interpretation of Findings

- The e-REC platform is a simple registry platform that can be used to capture information on new encounters with patients with rare endocrine and bone conditions.
- Although the number of centres that have registered to use the platform continues to increase, the number of centres that are actively reporting cases remains steady.
- There is wide variability in the number of cases encountered for different conditions amongst different centres.
- The proportion of cases that have a suspected diagnosis are higher in children compared to adults and may reflect the groups of conditions that are reported more often in these two groups.

Recommendations

- The use of the platform should continue to be disseminated widely.
- Members of ERNs should be able to utilize the platform for continuous reporting.
- Data are now available to investigators for further analysis and research.
